

Perimeter Defense Protection System

The power to protect. Before it's too late.

The Firebreak Perimeter Defense System, using Phos-Chek long-term fire retardant, is the gold standard in the industry for wildfire protection. Phos-Chek goes beyond mere suppression provided by foams and gels and is produced exclusively for Firebreak and our use. Phos-Chek is the ONLY long-term retardant product approved for use by the USDA Forest Service. When there is a wildfire event, and the system is activated, the retardant can help protect your home, and more importantly your possessions and memories.

Firebreak utilizes the most advanced technology available to lay down a defensible barrier of Phos-Chek to protect your property and can be activated manually, or remotely with a simple phone call. Just dial a number, enter a code, and your Firebreak system will deploy a defensive barrier of Phos-Chek any time of day or night.

Firebreak's Perimeter Defense System is a "stand alone" product and does not rely on any utilities on the owner's property. If the utilities have been shut off, or have been compromised by a wildfire, the system will function. When activated, a nitrogen gas powered pump distributes Phos-Chek from a large tank to specially designed commercial sprinkler heads and lays down a defensible barrier on your property. Once the danger is passed, call Firebreak and we will send our team of fire specialists to refill, recharge, and confirm everything is set for the next time you may need to deploy.
